AI usage policy

Business: Example Electrical Ltd Effective from: 1 December 2026 Responsible: Owner or managing director

Purpose and scope

This policy governs whether, under which conditions and for which purposes AI tools are used for work in this business. The business is the deployer of the tools used; the individual acts on its behalf. The policy applies to all employees and, as far as agreed by contract, to freelancers.

Source: Regulation (EU) 2024/1689, Art. 3 (4), consolidated version of 27 July 2026, EUR-Lex, retrieved 23 October 2026.

§ 1 Permitted tools and access

Only AI tools listed in the business's tool register with approval "yes" or "yes with restriction" (within the restriction) may be used for work. The register is kept by Office management. Use takes place through the access provided by the business.

Private accounts are not permitted for work tasks.

Business accounts carry no personal names; a functional email address of the business is used. The business accounts are managed by Office management.

§ 2 Permitted and prohibited uses

AI tools are used in this business for the following tasks: drafts of quotes and offers (text only; prices, calculations and customer details are added outside the tool), summaries of documents, translations and wording help in customer correspondence.

They are not used to select, filter, rank or assess applicants or staff, nor to prepare or make decisions on hiring, working conditions, promotion, task allocation, performance or termination.

§ 3 Prohibited inputs

The following is never entered into an AI tool, regardless of the access used: data about customers, staff and applicants by which a person can be identified; access data, passwords, keys and access codes; calculations, prices, contracts, customer lists and other information the business keeps confidential; health data; documents of third parties handed over in confidence; calculation sheets per job; access codes to customer sites.

In case of doubt nothing is entered; Office management is asked first.

§ 4 Handling unavoidable personal data

If a task cannot avoid personal data, the text is drafted with placeholders and the details are inserted afterwards outside the tool (for example: complaint letters are drafted with placeholders; office management inserts the details). Removing names and addresses is not enough where the context brings the person back.

§ 5 Review before use
